

Jedox Suite

Jedox Suite combines all three of Jedox's core applications — OLAP Server, Jedox Web, Jedox ETL Server and Jedox for Excel — into one comprehensive and customisable Business Intelligence platform.

The platform is completely based on Open Source products representing a high-end Business Intelligence solution which is available entirely free of any license fees.

- Jedox OLAP Server, key module of the Jedox Suite, offers increased stability and performance, as well as new logical algorithms. It is a multi-user, high-performance data server application that allows workers throughout an enterprise to access, change and collaborate on BI data instantaneously. Furthermore, it offers a real-time aggregation through the multi-dimensional data model.
- Jedox Web combines all Jedox components in a Web-Interface. Here all actions can be carried out, given the user rights that are claimed, allow Jedox Web access. Designer are able to administrate and create web-based reports, model the OLAP Database or monitor ETL-processes. Business users are able to view Planning and Analysis reporting in Jedox Web.
- The Jedox Suite allows users direct access via Microsoft Excel and Open office Calc by including Jedox for Excel . By doing so, existing applications (mostly Excel based) can easily be migrated and find further use. Entry into the Jedox Suite via Jedox for Excel is simple, and is achieved without previous Jedox experience.
- Jedox ETL Server is a Web-based data acquisition tool that extracts, transforms and loads data from transactional systems, data warehouses and other external sources. The application accepts data from relational database management systems, SAP, Web services and much more.

Jedox Suite is available as a community and a premium edition, with the premium version offering extended software assurance and support functionalities.
